wires and components of the circuit and has the form $V = IR$ where V is the potential difference in volts, I is the current flow with a unit of the ampere or amp for short, and R is the resistance in ohms Ω . The voltage drop is due to the internal resistance inside the batteries. This reduced voltage is known as potential difference, which depends on the connected load, while the emf (electromotive force) is the unloaded voltage of the battery or power supply. The potential difference is always less than the emf, and the emf is the maximum voltage.
